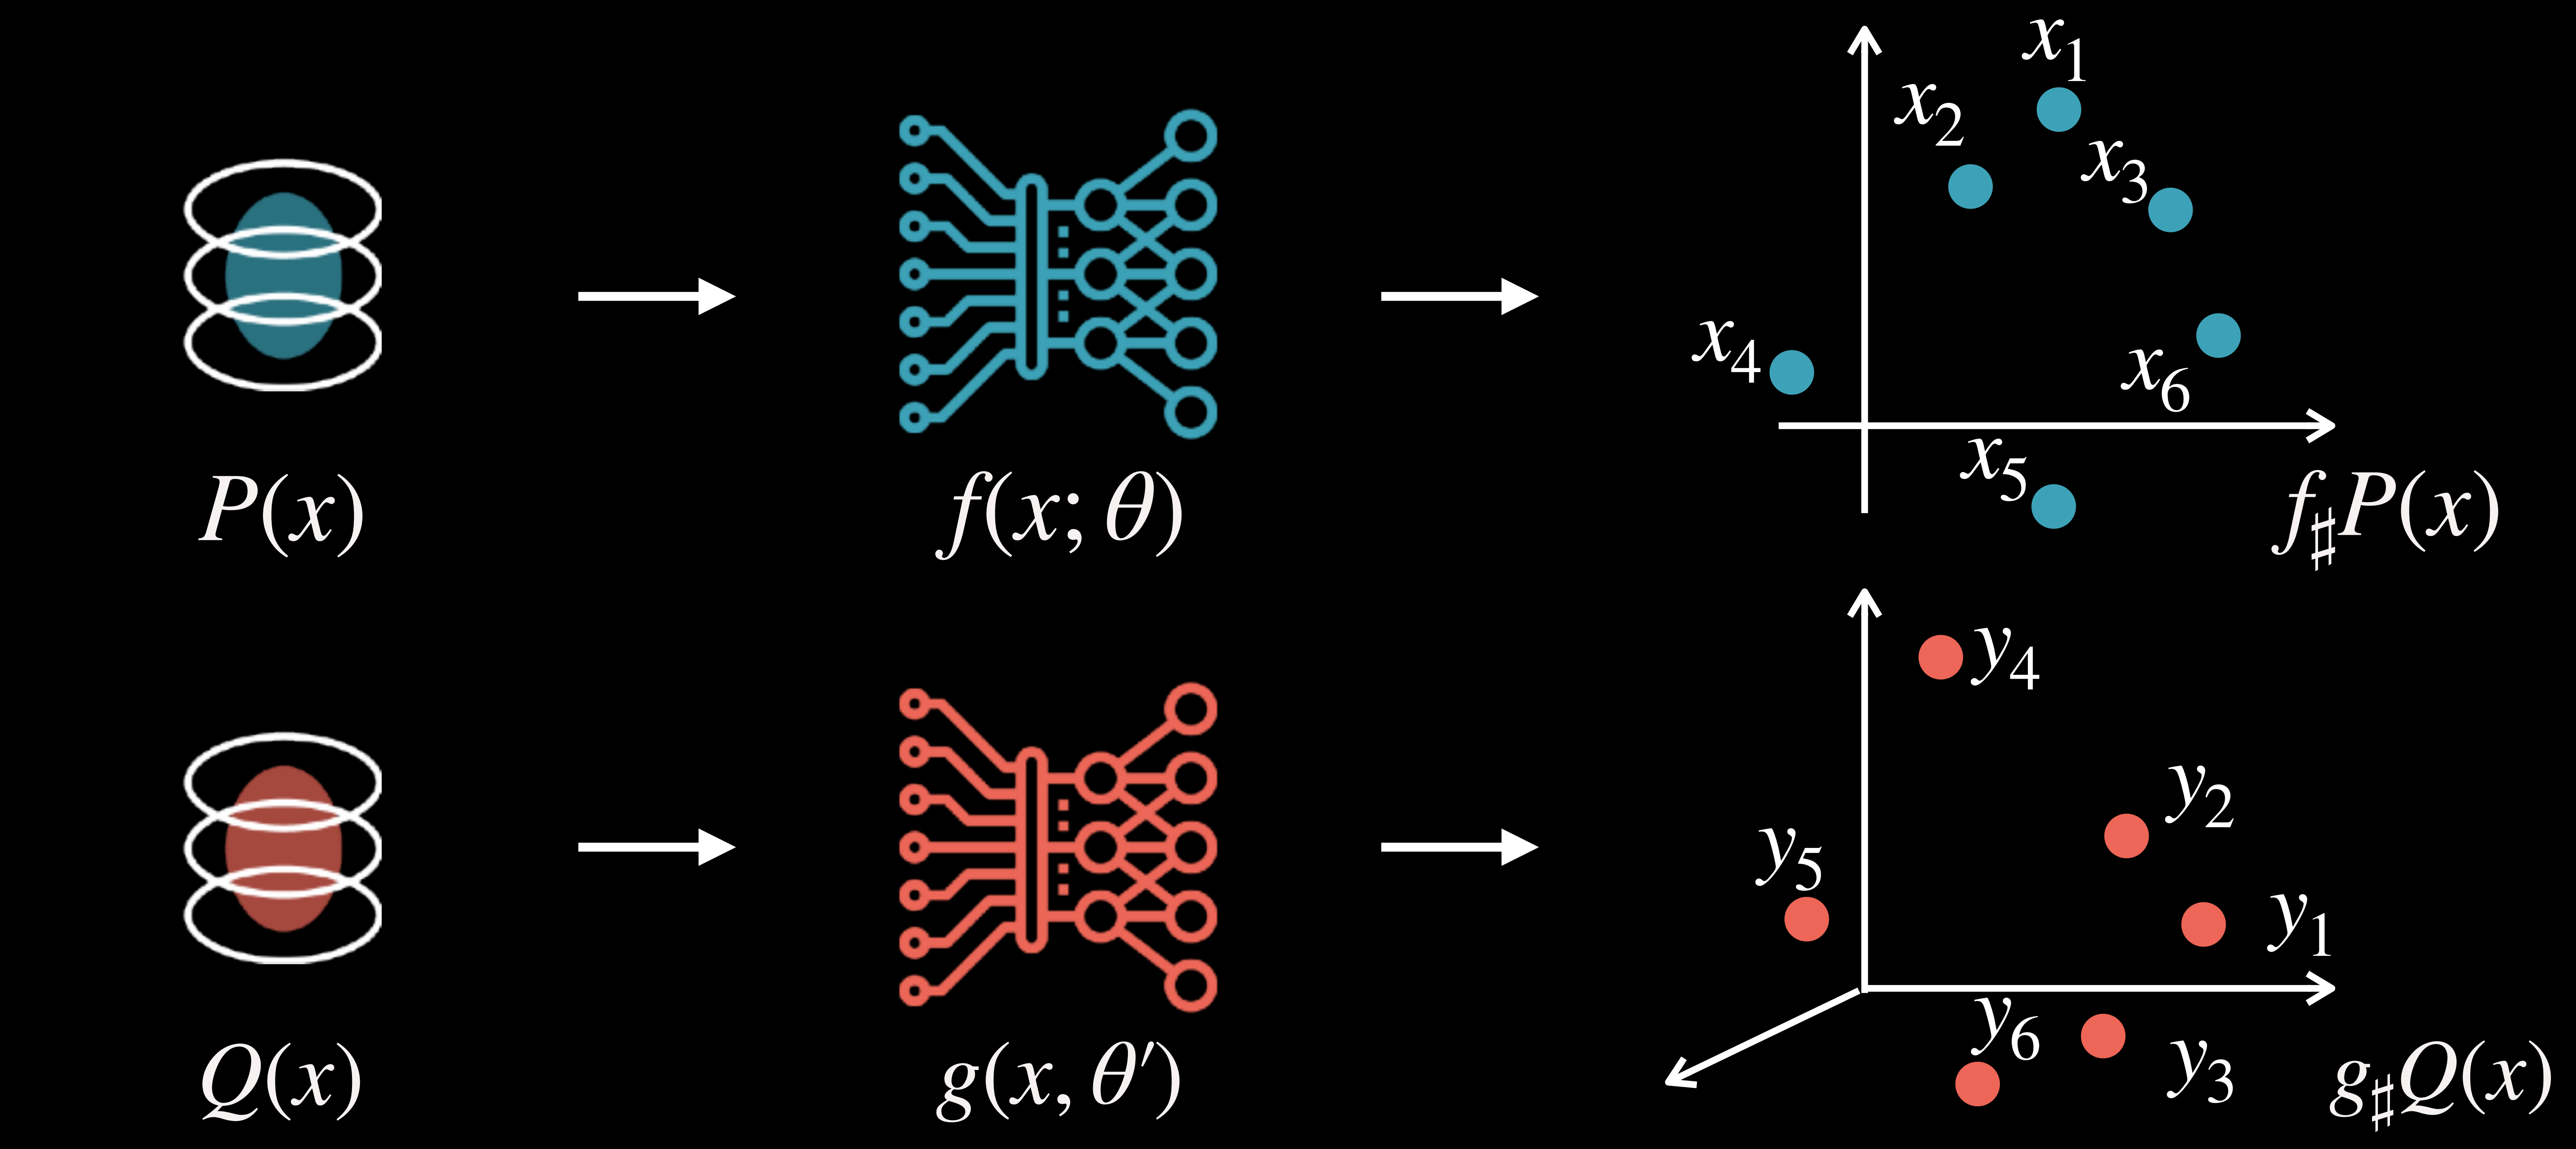
$P(x)$
$f(x;\theta)$
$f_\sharp P(x)$

$Q(x)$
$g(x, \theta')$
$g_\sharp Q(x)$

Gromov-Wasserstein: Motivation

- Often we need to compare distributions defined on different spaces
  - E.g., different geometry, dimensionality, or just different global orientation
- Example: aligning neural activations of different models



$d(x, y) = ?$

No cross-domain cost available

Motivation: Embedding Translation
