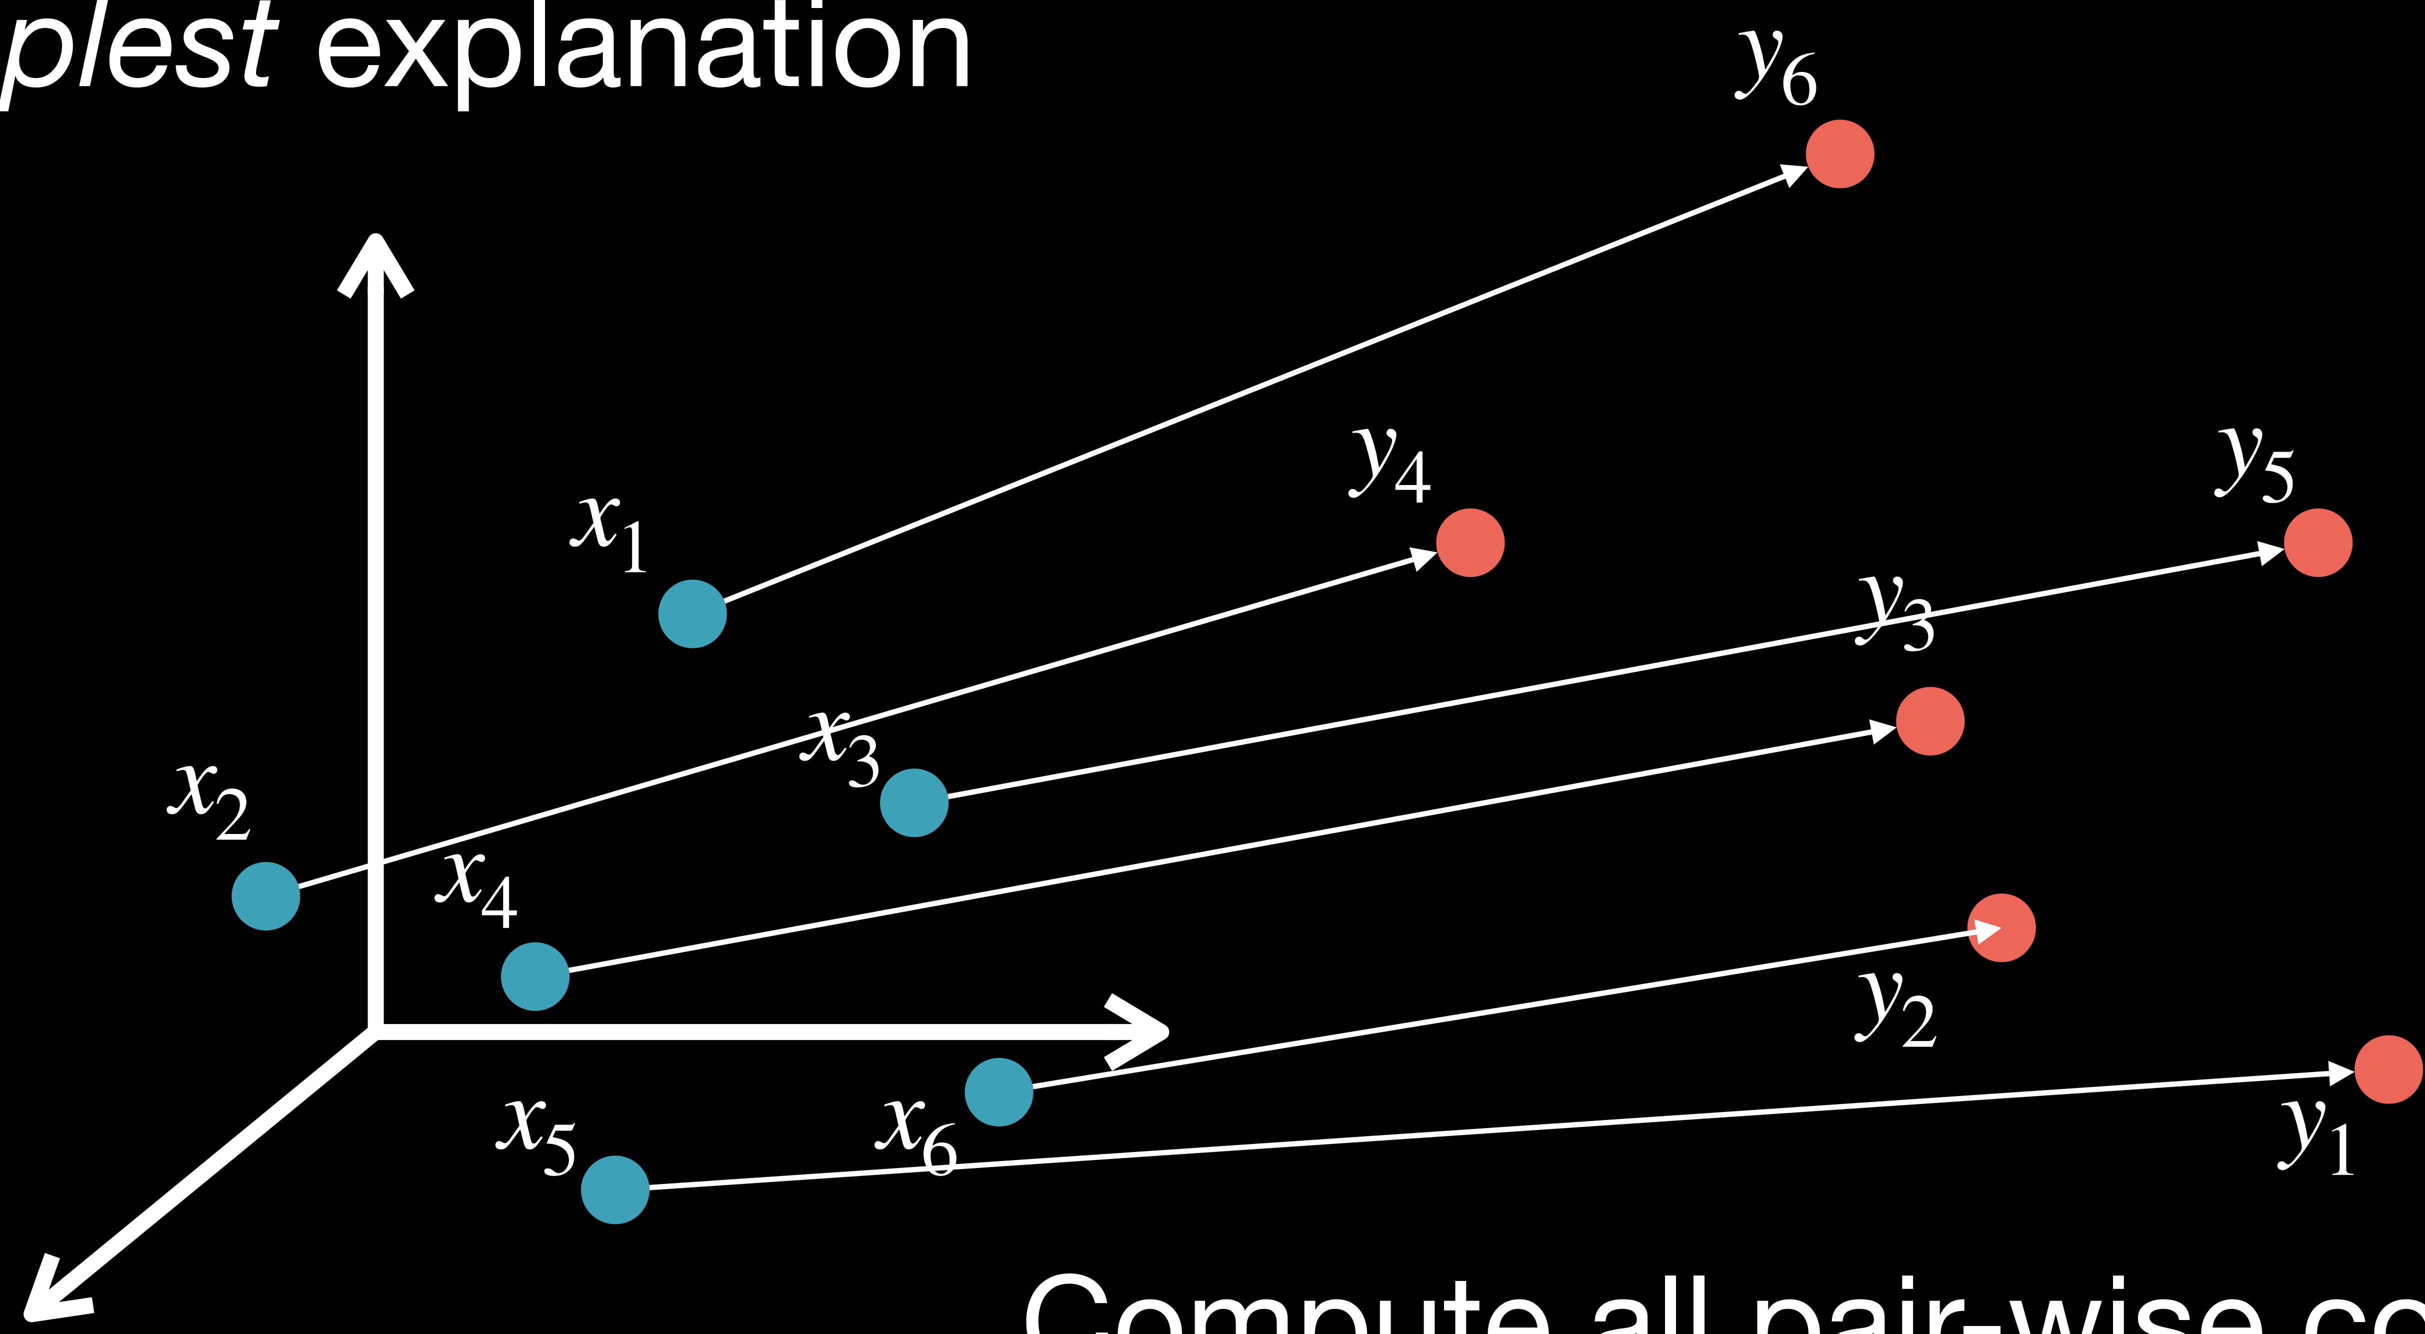
# Optimal Transport Cost/Distance

# Who went where?

OT wants the *simplest* explanation



Compute all pair-wise cost$(x_i, y_j)$

Simplest = minimal total cost: $$\min_{\sigma \in \mathcal{S}_n} \sum_{i=1}^{n} c(x_i, y_{\sigma_i})$$ Optimal Transport Cost/Distance

Best matching/permutation can be found using Hungarian algorithm

# Is that it?
