Interactive Demo: Bunny Interpolation

tinyurl.com/cs2840-lecture8

1. Implement displacement interpolation:

```
def dispalcement_interpolation(t, XA, T):
    """ Displacement interpolation at time t using
        barycentric map T on source X_src.
    Args:
        t: float in [0,1]
        XA: (N,3) source point cloud
        T: (N,3) barycentric map from source to target
    Returns: (N,3) interpolated point cloud at time t

    """
    # TODO: return the interpolated cloud at time t
     using X_src and T
    # Fill in here
    Xt = ...
    return Xt
```

Distribution:

$$\rho_t = \left[(1-t)\mathrm{Id} + tT\right]_{\#}\alpha$$

Particle trajectories:

$$x_t = (1-t)x + tT(x)$$

2. Choose ε values for Sinkhorn.

3. (Optional) Download mesh files for other shapes, try them out.
