Example: Gaussian → Gaussian

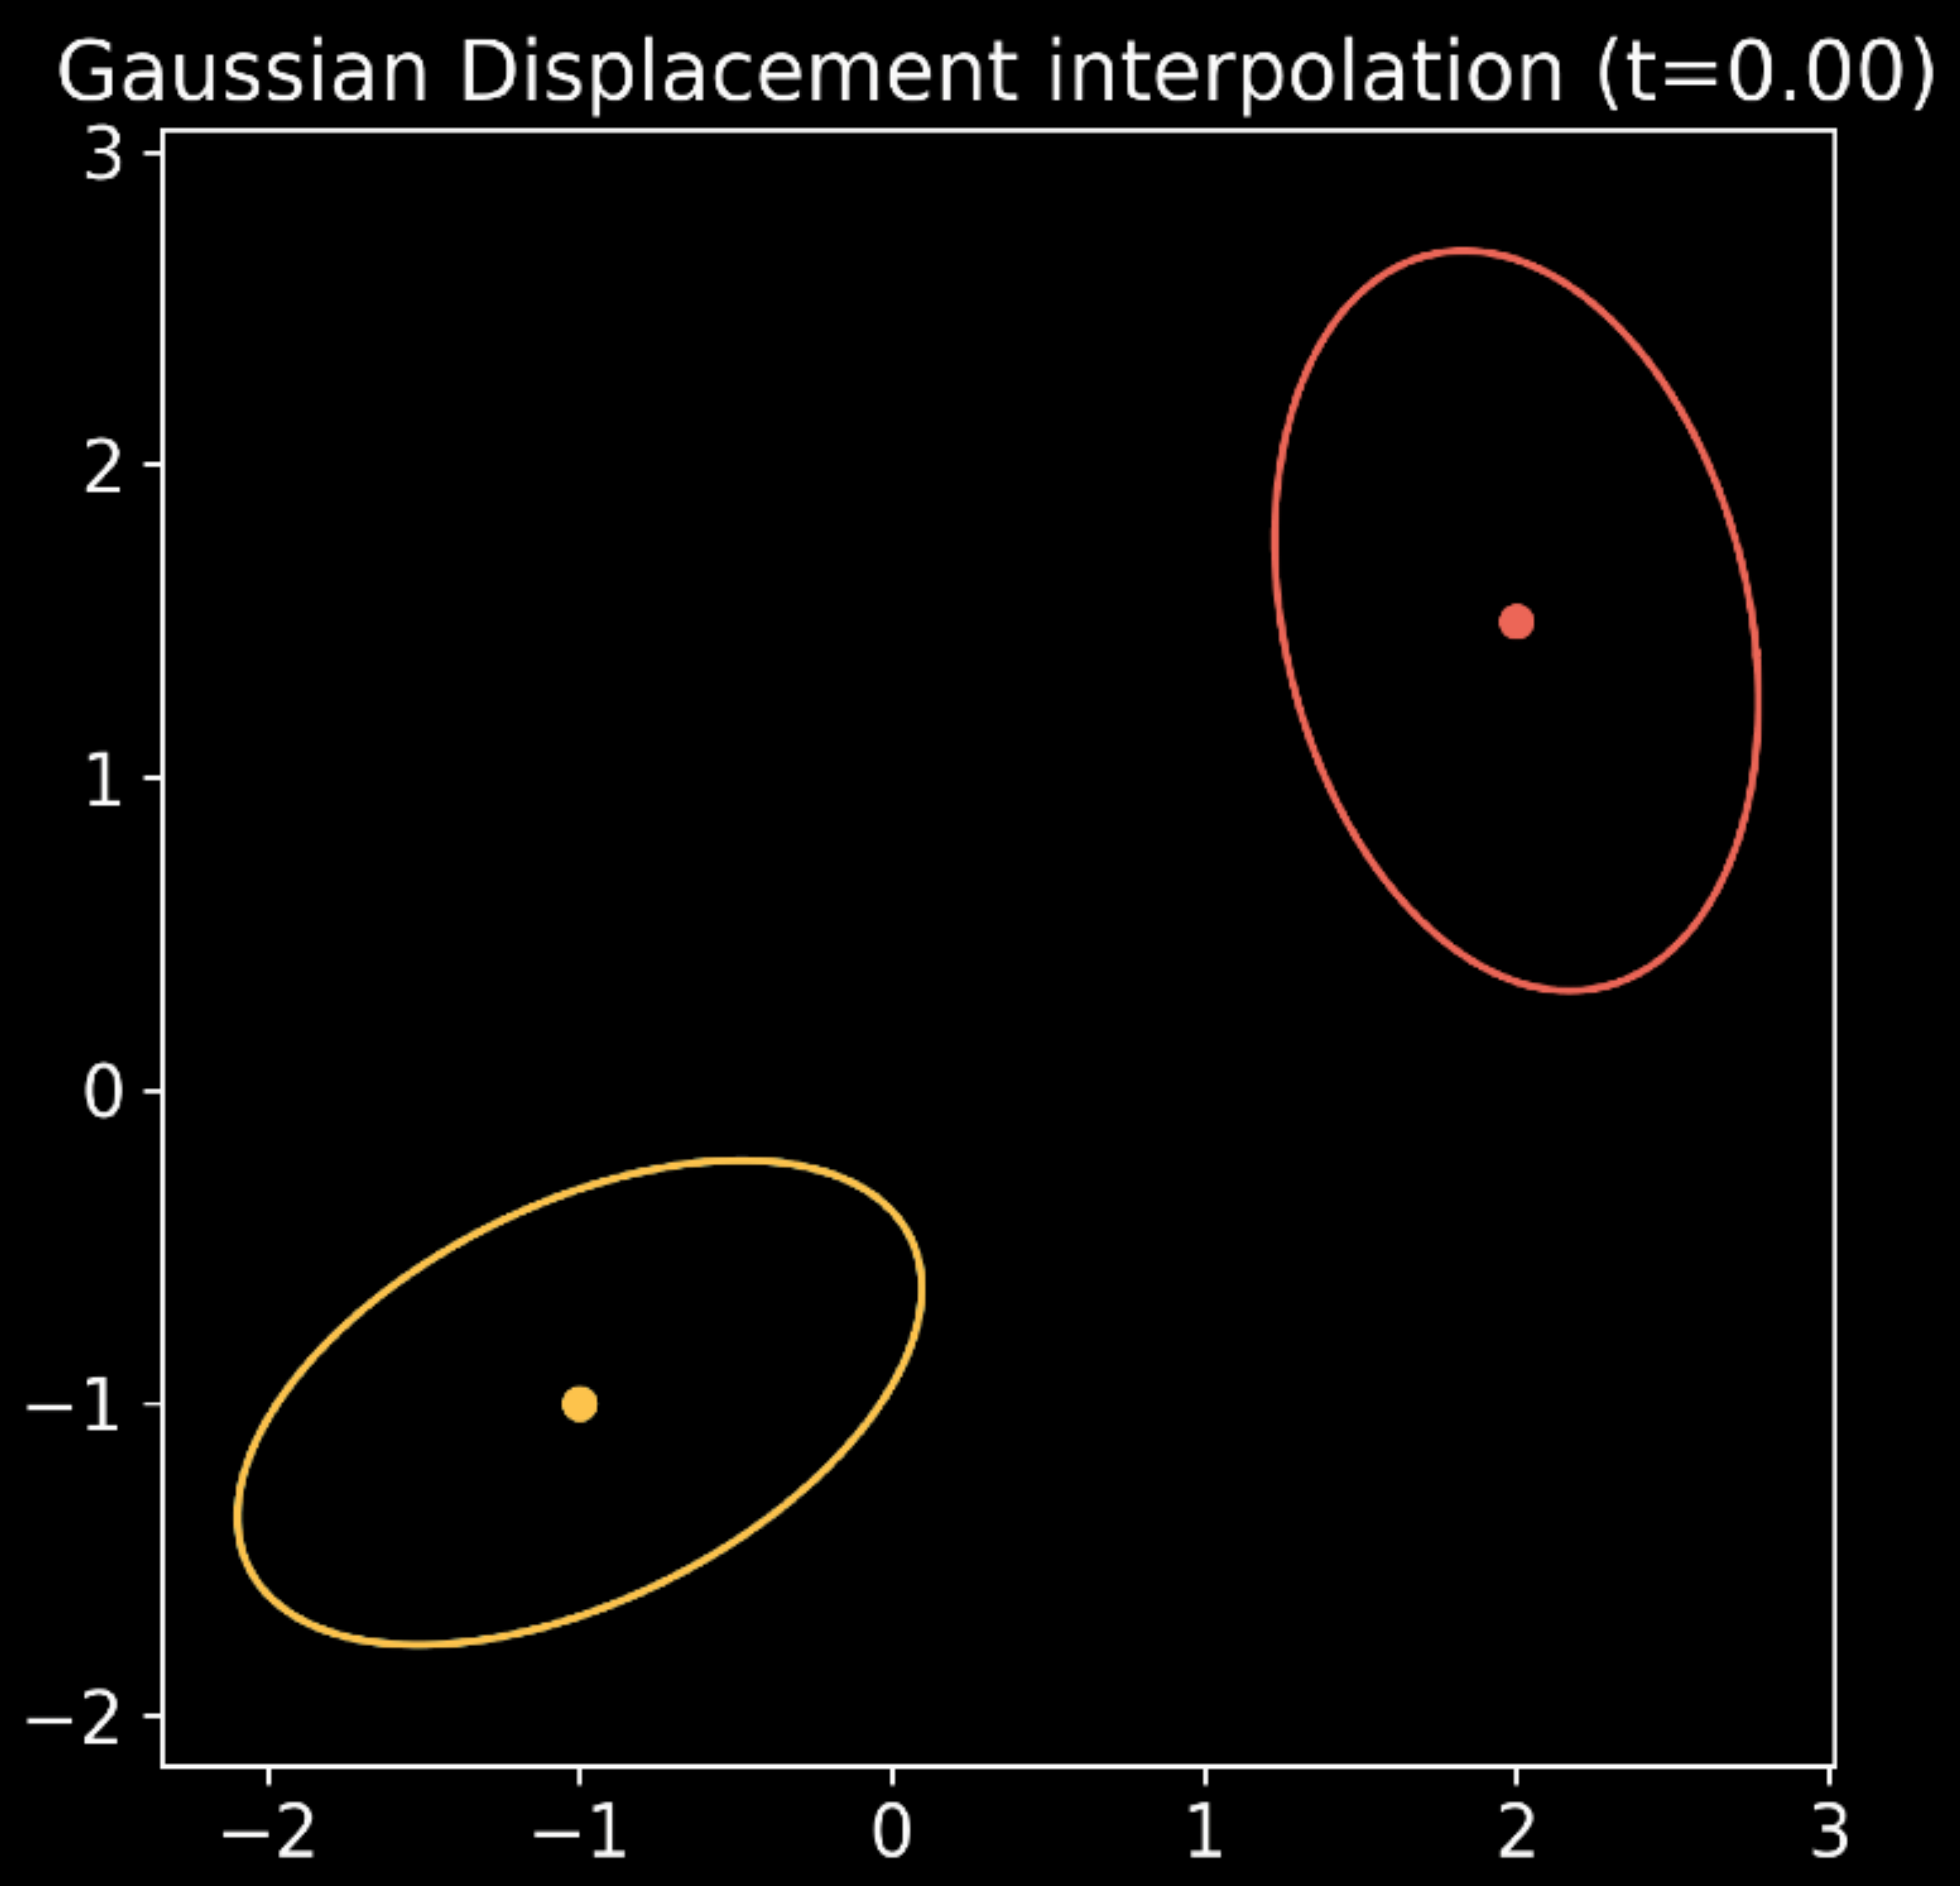
$\alpha = \mathcal{N}(m_0, \Sigma_0)$, $\beta = \mathcal{N}(m_1, \Sigma_1)$

Mean evolves linearly:

$$m_t = (1 - t)m_0 + tm_1$$

Covariance evolves nonlinearly:

$$\Sigma_t = \big((1-t)I + tA\big)\Sigma_0\big((1-t)I + tA\big)^T$$



Example: Gaussian → Gaussian
