

Prerequisites

- Necessary:
 - basic linear algebra (invertibility, rank, norms, eigenvectors, SVD, etc)
 - calculus (limits, derivatives, multivariate integrals, gradients)
 - probability theory (expectation, variance, independence, basic distributions)
- Very helpful:
 - familiarity with algorithms (runtime analysis, O notation, greedy vs dynamic)
 - optimization (especially LPs, duality, convexity, KKT conditions)
 - ML basics (loss fn's, ERM, generalization, overfitting, adversarial training)
 - coding (python; ideally pytorch, or TF — and if you're brave, JAX)

This might not be the right course for you if:
