

Eulerian Discretization

- Discretize $\rho_t(x)$ on a grid.
- Solve continuity eq. with finite-difference scheme.
- **Pros:** accurate PDE methods available
- **Cons:** expensive in high-dim (exponential on d , grid curse).

Lagrangian Discretization

- Approximate ρ_t with particles $\{x_i(t)\}$
- Dynamics: $\dot{x}_i(t) = v_t(x_i(t))$
- **Pros:** scalable in higher dimensions
- **Cons:** less stable PDE guarantees
