

$$\alpha = \delta_{x_0} \quad \beta = \delta_{x_1}$$

$$\rho_t = \delta_{(1-t)x_0 + tx_1}$$

$$\rho_t = (1-t)\delta_{x_0} + t\delta_{x_1}$$

1D Dirac transport (t=0.00)

1D Dirac linear interpolation ($t=0.00$)

1D Dirac transport (t=0.00)

1D Dirac transport (t=0.00)

1D Dirac linear interpolation ($t=0.00$)

1D Dirac linear interpolation (t=0.00)

Example: Dirac $\rightarrow$ Dirac

$$\alpha = \delta_{x_0}, \beta = \delta_{x_1}$$

Displacement interpolation =
'normal' (linear) interpolation

$$\rho_t = \delta_{(1-t)x_0 + tx_1}$$

Mixture interpolation = splits diracs

$$\rho_t = (1-t)\delta_{x_0} + t\delta_{x_1}$$

Linear vs Displacement Interpolation

2D example, Eulerian Discretization (grid) ~ histogram view of grayscale image

Euclidean (grid) interpolation (t=0.00)
